オリザ油脂化成株式会社 OIL & FAT CHEMICAL CO., LTD
1. Introduction

Recently, there is an increased awareness on metabolic syndrome – a condition characterized by a group of metabolic risk factors in one person. They include abdominal obesity, atherogenic dyslipidemia, elevated blood pressure, insulin resistance, prothrombotic state & proinflammatory state. The dominant underlying risk factors appear to be abdominal obesity and insulin resistance. In addition, non-alcoholic fatty liver disease (NAFLD) is the most commonly associated “liver” manifestation of metabolic syndrome which can progress to advance liver disease (e.g. cirrhosis) with associated morbidity and mortality. Lifestyle therapies such as weight loss significantly improve all aspects of metabolic syndrome, as well as reducing progression of NAFLD and cardiovascular mortality.

Walnut (Juglans regia L. seed) is one the most popular nuts consumed in the world. It is loaded in polyunsaturated fatty acids – linoleic acid (LA), oleic acid and \( \alpha \)-linolenic acid (ALA), an \( \omega-3 \) fatty acid. It has been used since ancient times and epidemiological studies have revealed that incorporating walnuts in a healthy diet reduces the risk of cardiovascular diseases. Recent investigations reported that walnut diet improves the function of blood vessels and lower serum cholesterol. Nevertheless, walnut is rich in micronutrients (vitamins & minerals), plant sterols and polyphenols.

A joint research project was conducted between Oryza Oil & Fat Chemical Co., Ltd. and Pola Chemical Industries, Inc. to study the physiological effects of testa of walnut. Various hydrolysable polyphenolic compounds were identified which are potent antioxidants and liver protective. Correspondingly, Walnut Polyphenol is believed to be beneficial in the treatment of metabolic syndrome.
2. WALNUT POLYPHENOLS

Most polyphenolic compounds of walnut are loaded in the testa of walnut fruit as illustrated in Fig. 2. These are hydrolysable polyphenolic compounds as shown in Fig. 3 and its principle constituents are as listed in Table 1.

![Fig. 2. The Content of Polyphenols in Walnut (%)](image)

3. Hepatoprotective Effect of WALNUT POLYPHENOLS

(1) In vivo

Liver is the second largest organ in the human body. It plays a major role in metabolism of human body including glycogen storage, plasma protein synthesis and drug detoxification. It regulates a wide variety of high volume biochemical reactions and breaks down toxic substances (e.g. chemicals, viruses, alcohol etc) which may result in toxication (Fig. 5).

Fig. 5. Liver Functions and The Effect of Walnut Polyphenols on Liver Health

(a) The effect of Walnut Polyphenols on CCl₄-induced liver damage in mice model (detoxification)

The effect of Walnut Polyphenols on CCl₄-induced liver damage was studied. This model is a simulated human hepatitis model as a result of oxidative stress and toxication. Upon liver damage, the liver enzymes GOT (glutamate oxaloacetate transaminase) and GPT (glutamic pyruvic transaminase) infiltrate into the blood stream resulting in elevated serum GOT & GPT levels. Walnut Polyphenols demonstrated a dose dependent lowering effect in GOT & GPT in CCl₄-induced liver damage in mice model (Fig. 6). Meanwhile, Walnut Polyphenols is more superior than Curcumin, a commonly used hepatoprotective agent.

Fig. 6. The Effect of Walnut Polyphenols on CCl₄-induced liver damage in mice model (n=8, mean ± S.E., *: p<0.05, **: p<0.01)
【Method of Experiment】
Fasting mice (ddY, male, 5-wk old) were orally fed Walnut Polyphenols. One hour later, back of mice were subcutaneously injected with 10% CCl₄ previously diluted in olive oil (5ml/kg). Blood samples were collected 20 hours later for measurement of serum GOT and GPT.

(b) The Effect of Walnut Polyphenols on D-galactosamine--induced liver damage in mice (detoxification)

The effect of Walnut Polyphenols on D-galactosamine (D-GaIN)--induced liver damage was studied. This is a simulated human viral hepatitis model based on immune responses and histological observations. As illustrated in Fig. 7, both GOT and GPT levels are elevated in the control group 10-hour post induction of D-GaIN. Meanwhile, group treated with Walnut Polyphenols demonstrated a dose-dependent reduction on GPT level although no changes observed in the GOT level.

![Fig. 7. The effect of Walnut Polyphenols on D-Galactosamine--induced liver damage in mice. (n=8, mean ± S.E., *: p<0.05, **: p<0.01)](image)

【Method of Experiment】
Fasting mice (ddY, male, 5-wk old) were orally fed Walnut Polyphenols followed by intra-peritoneal injection of D-galactosamine (300mg/kg) 1 hour later. Blood samples were collected 20 hours later for measurement of serum GOT and GPT.

(c) The Effect of Walnut Polyphenols on Ethanol--induced liver damage in mice

Ingestion of large amount of ethanol induce GOT and GPT elevations and decrease glutathione (GSH) in rats. [Borknt S. et al. World Gastroenterol. 12, 4345 (2006).] We evaluated the effect of Walnut Polyphenols on the model. As a result, Walnut Polyphenols suppressed GOT and GPT elevations, and the GSH was elevated (Table 2). Walnut Polyphenol is suggested to be effective for liver damage by ethanol.
Table 2. The effect of Walnut Polyphenols on Ethanol–induced liver damage in rats.

【Method of Experiment】
Fasting rats (Wistar, male, 8-wk old) were orally fed Walnut Polyphenols followed by oral administration of ethanol (10 ml/kg) 1 hour later. Blood samples were collected 2 hours later for measurement of serum GOT, GPT and GSH.

(II) In vitro
The Effect of Walnut Polyphenols on CCl₄-and D-GalN induced cytotoxicity in rat hepatocytes
The effect of each active component of Walnut Polyphenols on CCl₄ and D-GalN–induced cytotoxicity in primary cultured rat hepatocytes was evaluated in vitro. Results showed that tellimagrandin I (6), casuarictin (7), tellimagrandin II (10), and rugosin C (11) are inhibitory on CCl₄-induced cytotoxicity in primary cultured rat hepatocytes (as tabulated in Table. 3). Meanwhile, tellimagrandin I (6) of Walnut Polyphenols is believed to be the most important active responsible for hepatoprotective effect. Nevertheless, tellimagradin I (6) is the third largest component found within Walnut Polyphenols (Table 1).
On the other hand, many constituents including tellimagrandin I (6) and 2,3-O-(S)- HHDP-D-glucopyranoside (2) suppressed cytotoxicities. Fig. 8 shows structure-activity relation ship of walnut polyphenol. In CCl₄-induced cytotoxicity, galloyl glucose is essential for the activity ,and 2,3-O-(S)- HHDP-D-glucopyranoside (2) is minimum structure for the activity in D-Gal-induced cytotoxicity.

【Method of Experiment】
Rat primary cultured hepatocytes (4 × 10^4 cells/100 µL) were cultured (4 hr) and the medium was chaged to new one containing 5 mM CCl₄ or 10 mM D-GalN and samples. After 40 hr culture, cytotoxicity was evaluated by MTT assay.

4. The Effect of Walnut on Metabolic Syndrome

(1) The Effect of Walnut on Atherosclerosis

Epidemiological studies have associated nut consumption with a reduced incidence of cardiovascular mortality. Endothelial dysfunction is associated with atherosclerosis and its risk factors, including hypercholesterolemia. Ros E. et al. reported that substituting walnuts for monounsaturated fat in a Mediterranean diet improves endothelium-dependent vasodilation (EDV) in hypercholesterolemic subjects. As illustrated in Fig. 9, daily intake of 8-13 walnuts for 4 weeks significantly improve the EDV of 21 hypercholesterolemic males and females.

Fig. 9. The effect of Walnut enriched diet on endothelium-dependent vasodilation (EDV) of hypercholesterolemic patients.

Fig. 10. The Fatty Acids Composition of various nuts (PUFA: polyunsaturated fatty acid, MUFA: monounsaturated fatty acid, SFA: saturated fatty acid), Right figure, Fatty acid composition in walnut oil (Left, table).
Fig. 10 illustrated the fatty acids composition of various nuts commonly available in our diet. Walnuts, differ from other nuts, are loaded with $\alpha$-linolenic acid, a plant $\omega$-3 fatty acids, which may have protective effect on cardiovascular health by reducing blood cholesterol and triglyceride levels.

(II) The Effect of Walnut on Cholesterol

There are several reports documented the beneficial effect of walnuts on hyperlipidemia. [Mukuddem-Petersen J., et al., J. Nutr. 135, 2082-2089 (2005)] In one study conducted by Iwamoto M et al. on Japanese subjects are particularly interesting. Iwamoto M et al., reported that incorporating moderate quantities of walnuts into the average Japanese diet while maintaining the intake of total dietary fat and energy decreases serum total cholesterol concentration and favorably modifies the lipoprotein profile in Japanese, particularly in women. In this study, daily intake of 43 to 57g of walnuts was incorporated into Japanese diet for 4 weeks to 40 healthy Japanese men and women. As illustrated in Fig. 11, blood cholesterol of test subjects was lowered, particularly in women.

![Graph showing the effect of walnuts on total cholesterol](image)

Fig. 11. The effect of Walnuts on Total Cholesterol (*: $p<0.05$)

On the other hand, Bellido C.E. et al., reported that walnut-enriched meals effectively prevented post prandial lipidemia where triacylglycerol in large triacylglycerol is significantly reduced.

![Graph showing the effect of walnuts on postprandial blood triacylglycerol](image)

Fig. 12. The Effect of Walnuts on postprandial blood triacylglycerol.
(III) Effect of Walnut Polyphenol on hypercholesterolemia

We investigated the effect of Walnut Polyphenol on hypercholesterolemia in mice fed high cholesterol diet and high fat diet. By 6-day oral treatment of Walnut Polyphenol (200 mg/kg), serum and liver cholesterol were decreased in high cholesterol diet fed rats (Table 4). Walnut Polyphenol was found to decrease cholesterol level in diet-induced hypercholesterolemia.

【Method of Experiment】

Mice (ddY, male, 5-wk) were fed high cholesterol diet for 6 days and Walnut Polyphenol (200 mg/kg) was given orally once a day. Mice were fasted during 6 to 7 day and blood and liver were collected.

(IV) Effect of Walnut Polyphenol on hypertriglychemia and fatty liver

We investigated the effect of Walnut Polyphenol on high fat diet –fed mice. High fat diet was fed to mice for 2 weeks and Walnut Polyphenol was given orally once a day. As shown in Table 5, Walnut Polyphenol reduced increase in body weight, liver weight, liver triglyceride and serum triglyceride.

【Method of Experiment】

Mice (ddY, male, 10-wk) were fed high fat diet for 2 weeks and Walnut Polyphenol was given orally once a day. Then mice were fasted and organ and blood were collected.

(V) Effect of Walnut Polyphenol on lipid metabolism in liver

As Walnut Polyphenol did not suppress intestinal lipid absorption and fat accumulation, we evaluated on beta-oxidation in mouse liver fed high fat diet. Liver homogenate was divided into mitochondrial and cytosolic fractions by centrifugation and following reaction was induced using palmitoyl CoA and NAD.

$$
\text{CH}_3(\text{CH}_2)_n\text{CO-S-CoA} + \text{O}_2 + \text{NAD} + \text{CoA} \rightarrow \text{CH}_3(\text{CH}_2)_n\text{CO-S-CoA} + \text{H}_2\text{O}_2 + \text{NADH} + \text{H}^+ + \text{acetyl-CoA}
$$

According to the change of absorbance at 340 nm caused by reduction of NAD, Walnut Polyphenol did not suppressed mitochondrial beta-oxidation, however it tended to enhance cytosolic beta-oxidation (Table 6). Walnut Polyphenol was found to enhance cytosolic beta-oxidation including microsome.

Table 6. Effect of Walnut Polyphenol on beta-oxidation in mouse liver fed high fat diet

Mean ± S.E. (N=5-7)

In addition, by the investigation of hepatic mRNA expression related to lipid metabolism, expression of PPARalpha and acyl CoA oxidase (ACOX1) were enhanced (Fig. 13). On the other hand, carnitinepalmitoyl transferase (CPT)1A, a rate-limiting enzyme on mitochondrial beta-oxidation did not enhanced. Therefore Walnut Polyphenol was found to enhance cytosolic
beta-oxidation via PPARα.

Fig. 13. Effect of Walnut Polyphenol on mRNA expression related to lipid metabolism in mice fed high fat diet.

Mean ± S.E (N=5-7)

These results implicate that Walnut Polyphenol reduce serum and liver triglyceride by enhance liver cytosolic beta-oxidation.

( VI ) The effect of Walnut Polyphenols on Diabetes Mellitus

Dr. Fukuda of Pola Chemical Industries, Inc. has conducted extensive studies on the effect of Walnut Polyphenols on diabetes mellitus especially on the enzyme glycosidases. The IC₅₀ of each active component of Walnut Polyphenols on glycosidases is tabulated in Table 3. Walnut extract and its polyphenolic components, especially casuarictin (7) and tellimagradin II (10) demonstrated strong inhibitory activity against amylase. Meanwhile, tellimagrandin I (6), tellimagradin II (10) & casuarictin (7) are three most potent walnut polyphenolic components against maltase activity. Walnut Extract and its polyphenolic components showed similar inhibition against the enzyme sucrase.

In a research conducted by Fukuda et al., reported that walnut polyphenol-rich fraction (WPF) lowered elevated blood glucose level post-loading of starch and sucrose in mice model (Fig. 14).

**Starch-loaded**

**Sucrose-loaded**

![Graphs showing blood glucose levels over time for starch and sucrose-loaded conditions with and without WPF treatment]

Fig. 14. The effect of Walnut Polyphenol-rich Fraction (WPF) on Blood Glucose Level Post-Loading of Starch and Sucrose in Mice (mean ± S.E., n=23, *: $p<0.05$, **: $p<0.01$)

Fukuda et al., The 50th Meeting of the Japanese Society of Pharmacognosy, Sep 12-13, 2003 (Tokyo), The 51st Meeting of the Japanese Society of Pharmacognosy, Sep 9-10, 2004 (Kobe).

[Method of Experiment]

Blood sample was collected from fasting mice (ddY, male, 10-week old) for measurement of initial blood glucose level prior to loading of starch and sucrose. Test sample A (containing Walnut polyphenol-rich fraction [WPF] and soluble starch 2g/kg)
and test sample B (containing Walnut polyphenol-rich fraction [WPF] and sucrose 2g/kg) were orally given to mice 20 minutes later. Blood samples were collected at 30, 60, and 120 minutes for measurement of blood glucose level.

In addition to the above findings, research also noticed that Walnut polyphenol-rich fraction (WPF) has triglyceride lowering effect and urine peroxide lowering effect in genetically inherited Type II diabetes mellitus (db/db) mice as shown in Table 4.

[Method of Experiment]
Mice (C57BL/KsJ-db/db, male, 9-week old) were fed walnut polyphenol-rich fraction 200mg/kg/day for 4-week. After 4-week, mice were placed in individual metabolic cages for urine collection for 8 hours and blood sample was collected after overnight starvation. Urine 8-OHdG, blood glucose and triglyceride levels were measured respectively.

5. Other Functional Activities

(I) Skin-lightening activity (Inhibition of hyperpigmentation)

The effect of Walnut Polyphenols on skin hyperpigmentation was examined using B16 melanoma cells in vitro. Pre-cultured B16 melanoma cells were incubated in medium containing Walnut Polyphenols and melanin cells formation was determined. As illustrated below, Walnut Polyphenols inhibited melanin formation at concentration 1 to 30µg/mL. Apparently, Walnut Polyphenols is more superior than the popular skin-lightening agent, ascorbic acid and arbutin upon data comparison (Fig. 15).

Fig. 15. The Effect of Walnut Polyphenols, Ascorbic acid and Arbutin on B16 Melanoma cells. (mean ± S.D., n=5)
Data of The Effect of Ascorbic Acid & Arbutin on B16 Melanoma cells were cited from: Aitani M. and Shimoda H. Japan Food Science, 44, 58-63 (2005).

(II) Suppression of bone absorption

Alpha-linolenic acid (omega 3 fatty acid) which is rich in walnut was reported to improve bone condition. To evaluate plant-derived omega 3 fatty acid rich diet on bone metabolism in human, serum N-teropeptide (NTx) and bone specific alkaline phosphatase (BSAP) were determined as bone absorption and remodeling markers, respectively. Six-weeks ingestion of the diet significantly reduced NTx (Fig. 16). The result indicates that ingestion of omega 3 fatty acid rich diet suppress bone absorption.

Fig. 16. The serum NTx after ingestion of the diets (mean ± S.E., n=23)
AAD: Common American diet, LA: linolic acid rich diet, ALA: alpha-linolenic acid rich diet, a: significant difference: p<0.05.
6. Stability of Walnut Polyphenols

(I) Thermostability

Fig. 17 illustrated data of Thermostability of Walnut Polyphenols (without binder). The polyphenols content remained stable at temperature 100°C and 120°C for 1 hour. Walnut Polyphenols is highly stable.

(II) pH Stability

Fig. 18 illustrated data of pH Stability of Walnut Polyphenols on Day 1 and on Day 7. Walnut Polyphenols solution (0.5%) was prepared and stored under different pH at room temperature for 1-day and 1-week. Results showed that Walnut Polyphenols is highly stable at acidic and neutral conditions but degraded at alkaline condition.
7. **Nutrition Information (Walnut Polyphenols)**

Test trustee: SRL
Data: September 15, 2006
Report No.: 2006090400032

8. **Safety Profile of Walnut Polyphenols**

(I) **Residual Agricultural Chemical**

Walnut Polyphenols (without binder) is confirmed to regulation stipulated for 447 residual agricultural chemical compounds. No residual agricultural chemicals detected as confirmed by test trustee.

Test trustee: Masis Co. Ltd.
Data: September 4, 2006
Report No.: 7035

(II) **Acute Toxicity (LD50)**

Fasting male and female mice (ddY, 5-week old) were given orally 2,000mg/kg Walnut Polyphenols (no binder) in accordance to Single Dose Toxicity Test Guideline for Pharmaceuticals. Mice were maintained for observation for 14 days. No fatal event occur nor abnormal changes observed upon comparison with control group. No evident abnormalities detected in organs upon autopsy. Oral LD50 of Walnut Polyphenols is deduced to be >2,000mg/kg for both male and female mice.

(III) **Human Consumption Test**

4 male volunteers were given oral Walnut Polyphenols (without binder) 50mg/day for 4 weeks. Blood profile screening was carried out for analysis prior to and after the test. No abnormal reading detected in blood profile screening.

Blood profile screening: Total bilirubin, Total protein, Albumin, AST, ALT, LDH, LAP, \( \gamma \)-GTP, cholinesterase, amylase, lipase, L-CAT, LDL-cholesterol, total cholesterol, triglyceride, phospholipid, FFA, HDL-cholesterol, Na, K, serum Fe, TIBC, UIBC, urea nitrogen, uric acid, glucose, hemocytes.
9. Dosage Recommendation

The recommended daily dosage of Walnut Polyphenol-P10 & Walnut Polyphenol-WSP10 is 50 to 150 mg.

10. Crude Material Equivalent

1g of Walnut Polyphenols is equivalent to 200 edible portion of walnuts. Recommended daily consumption of walnut is 10 – 30 walnuts.
